

## **Magnetic Separators for Midstream Applications**

A review of one facility's approach to testing and adopting magnetic separators as a solution for improving facility up-time, reducing filter consumption, and minimizing rotating equipment repair costs.

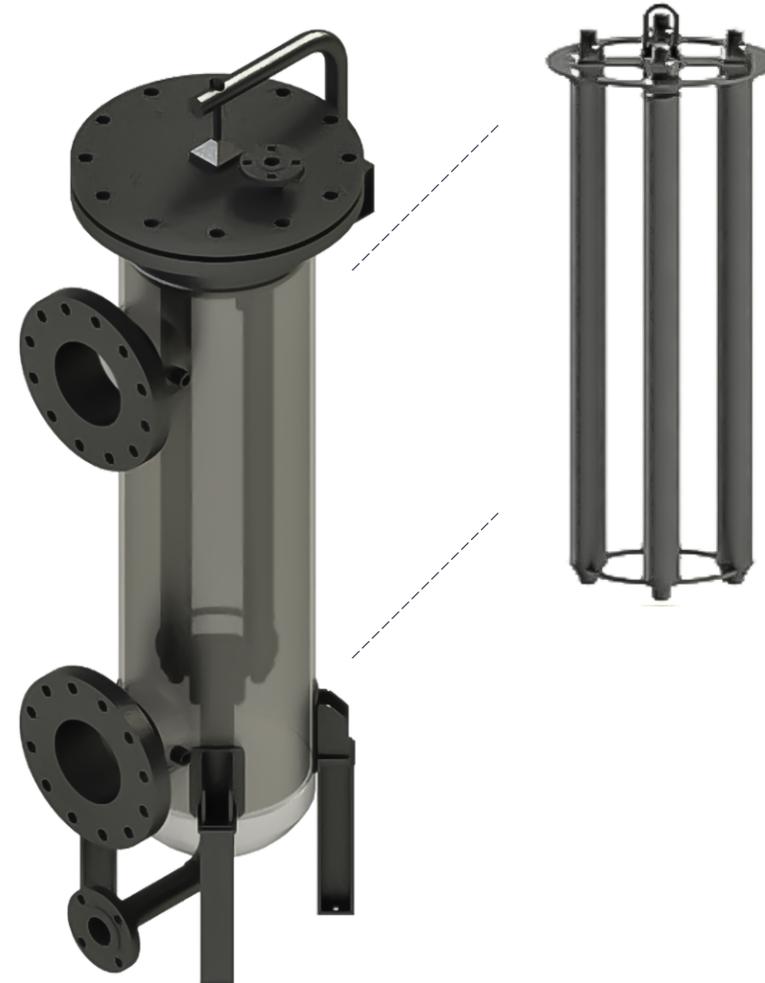

**FEBRUARY 2020**

# MAGNETIC SEPARATOR SYSTEMS

Black Powder Solutions' patented magnetic separator systems utilize proprietary permanent rare earth magnetic technology to remove black powder contamination or rouge (ferrous and non-ferrous particulates) from hydrocarbon liquids and gasses, as well as amine, glycol, water and lubrication.

\*No membrane filters employed.

## Trial

Black powder (or rouge) contamination issues exist in multiple facility processes and fuel systems. The client, a 200,000 bpd+ refinery, decided to test a Black Powder Solutions' (BPS) magnetic separator system to evaluate its effectiveness capturing sub-10 micron contaminants.

Trial success would be determined by contamination capture, reduced disposable filter costs and projected unit performance in:

- (1) Hydrodesulfurization (HDS) unit amine system;
- (2) Vacuum gasoil feed into the HDS unit;
- (3) 2 separate furnace fuel gas systems; and
- (4) Turbo compressor lube system in the fuel complex.

BPS provided a test magnetic separator (Class 600#, single magnetic element) to the refinery along with flexible steel hoses for plug-and-play testing purposes.

BPS magnetic separator installed in the hydrocracker fuel gas system.

## Testing

The testing process continued through most of calendar 2019, with the unit being moved between systems. BPS provided flow, pressure and temperature parameters for purposes of understanding maximum testing values – particularly flow rates.

## Recommendations

1. The installation of a flow meter and valves on test magnetic separator systems so that maximum flow rates are not exceeded, and accurate test results are achieved.
2. Contamination samples be collected to determine the mass, composition and sizing of particulate contamination and the efficiency of magnetic separation in each application.

BPS magnetic separator installed in the HDS amine system during testing, as well as contamination captured on the magnetic separator element.

## Results

The test results were very positive according to the facility staff. The refiner is proceeding with the permanent installation of multiple magnetic separators in different systems:

1. 3 separate crude feed streams (120 kbopd, 85 bopd & 17.5 kbopd);
2. VGO feed stream;
3. Combined VGO/LGO/MGO/HGO feed stream;
4. Amine system in the HDS unit; and
5. Fuel gas system in the hydrocracker and other fuel gas streams.

BPS magnetic separator removed for cleaning from VGO feed to the HDS unit.

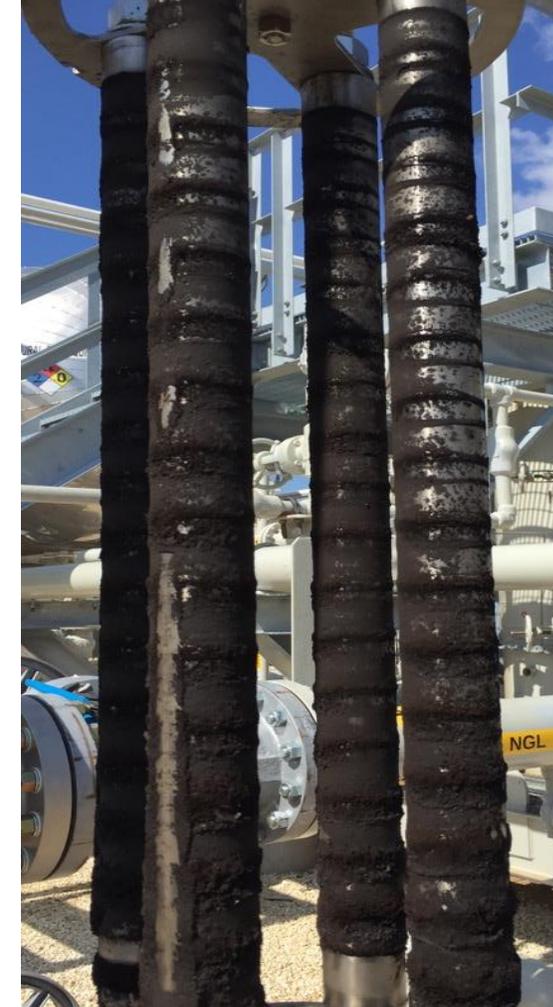

# WHERE IS THE BIGGEST IMPACT?

## Where do you start?

While magnetic separators offer substantial benefits, a few simple questions can prioritize deployment for quick wins:

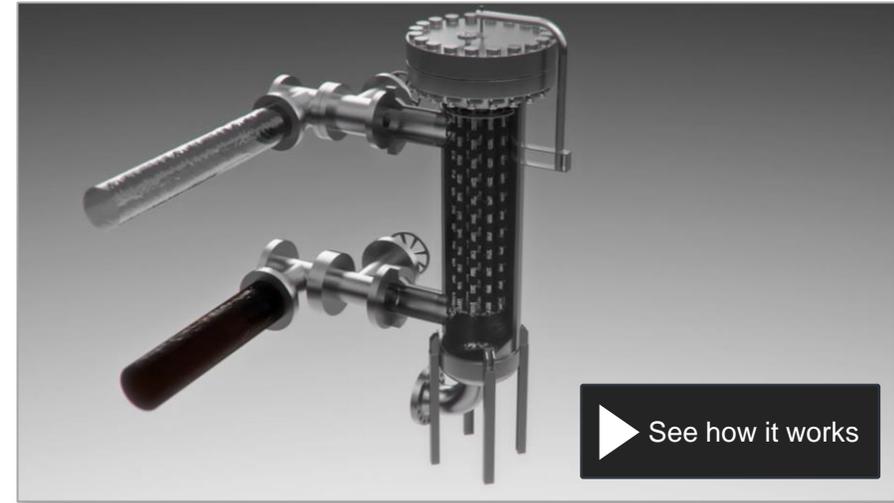

1. How much would you save if disposable filter changeouts & costs were reduced by as much as 90%?
2. What is the financial impact of extending pump, compressor and seal life by a factor of at least 2X?
3. What are the savings from a 50-80% reduction in lube-related maintenance on rotating equipment?
4. What is the value of a > 75% reduction in worker hazard exposure due to reduction in planned and unplanned maintenance and repair events? What about man-hour savings?
5. What is the value of a substantial reduced environmental footprint as a result of reduced filter waste, chemical use and wastewater disposal?

Contamination captured on a condensate stabilizer column

## Key Product Features

- Established products - patented magnetic technology **originally developed over 18 years ago** by our sister company, One Eye Industries, which manufactures industrial magnetic filtration products for multiple different applications.
- High efficiency (95%+) removal of black powder **above 500 microns down below 0.1 microns** – no absolute or nominal filter ratings.
- Systems only require cleaning via scraping of the magnetic elements. Only the contamination is disposed – **no disposable filter elements**.
- Typically **well below 5 psi differential pressure** in fully contaminated systems, vs. typical pressure alarms at +/- 25 psi.
- Standalone system – **no power or fuel requirements** due to permanent rare earth magnetics.
- Permanent solution – **longest system in use is 17 years** (and running) with original equipment - no reported performance degradation.
- Typical magnetic separator system **holding capacity is measured in hundreds of pounds** and cleaning intervals are measured in months.
